

## Traffic Site Mapping Tool

### Description and Benefit

The Traffic Site Mapping Tool, is a new and improved way to keep track of information on our permanent traffic counting sites. Previously, the traffic site inventory was maintained through an outdated web application. Users would need to know the exact ID of a site in order to find and make updates to it in the application. A report would have to be generated in order to know the status of each site and a text description of where that site was located. Now, with just a quick look at the map, users are able to see the physical location and the status of all sites in the state. The tool updates site attributes, the status of the sites, and tracks any issues that sites have. This innovation works alongside an interactive map that displays all of our permanent traffic sites across the state. The map displays real time data and any updates made with the tool are updated on the map instantly. Sites are displayed by status, so users can get a quick overview of which sites are working and which ones need some attention. Users are able to zoom and pan in the map to get an exact location of where the permanent site is located.
