Signpost Step Plus

Description and Benefit

The Signpost Step Plus is constructed from materials already available at most MoDOT maintenance facilities that are destined for a recycling yard, now instead can be used in assisting the process of sign work along the state highways. It is assembled using any damaged or already used 2" or 2 ½" sign post bases. All that is needed is at least 24" of straight, 2" or 2 ½" sign post base. One, 7/16 x 2", grade 5 or 8 bolt. A metal cutting chop saw, band saw or metal cutting wheel will be needed to cut pieces of metal and a welder will be needed to put pieces together. This innovation simplifies work by making it possible to reach just out of reach bolts and nuts on signs and helps support any step ladders that may be used by making sure they do not roll or slide away from the sign post.
