

Trash Terminator

Description and Benefit

The Trash Terminator is a modified hydraulic pull broom that will save time and money by providing a fast efficient means of collecting trash along the right of way. It is operated via hydraulics and pulled by a tractor. The design allows for the operator to pick up trash without having to have boots on the ground. It will dump the basket contents at crossovers where it can be collected and transported to the dumpster. This saves time by speeding up the trash collection process and saves money by reducing the amount of employees on the job. It simplifies the job by making trash collection somewhat automated and improves safety by reducing the amount of boots on the ground since it is completely controlled from the safety of the tractor cab!
